Installation of R and R Commander

Mac OS

1. Download R from http://cran.uib.no/bin/macosx (blue link on the left, e.g. R-3.4.4.pkg or newer) and install it.

2. Download the newest version of XQuartz from https://www.xquartz.org and install it.

3. **Log out of Mac OS using the menu in the top left corner of the screen** and log in again. It is not enough to restart your Mac or turning it off and on again!

4. Start R and copy (or write exactly) the following into the R window:

   ```
   source(url('https://repository.nmbu.no/R/run.R'))
   ```

   (R Commander is installed together with a lot of extra packages. If you get questions regarding making a personal library or installation of missing packages, answer Yes and OK. At the end the R Commander window will open and the installation is finished.)

R Commander can later be started by writing the following in the R window:

```
library(nmbu)
```

(After updating of Mac OS it may be necessary to reinstall XQuartz and log out/in to Mac OS again.)
